

Groundwater (IAHS Benchmark Papers in Hydrology Series)

Mary Anderson's selection for this Benchmark Series volume, and the commentaries that she has prepared to accompany the 35 reprinted papers, detail the development of groundwater hydrology during the 20th century. The fundamentals are covered with a translation of Darcys experimental results that led to Darcys law, as well as classic papers by Meinzer, Theis and Hubbert, among others. The development of pumping test theory and practice, approaches to estimating aquifer parameters in the field, and flow system analysis are dealt with. Papers reflecting early concerns regarding quantification of uncertainty, how recognition of groundwater interaction with surface water grew, and research on contaminant occurrence and transport, are included. Slichters (1905) seminal contribution that identified dispersion in the field, and Skibitzke & Robinsons (1963) laboratory findings, are linked with more recent attempts to represent dispersion and heterogeneity with models. The International Association of Hydrological Sciences is the worlds premier member-based organization promoting the study and practice of Hydrology. Our books are authored, edited and produced at the highest level of quality, with the most current and thorough research. Our publications and our work advance the science and the professional practice of Hydrology in a variety of Science and Engineering fields around the world. The areas that we publish in include: -Ground water -Surface water -Snow and ice hydrology -Drought and desertification -Runoff modelling -Watershed -Remote sensing -Water quality -Water resources and management -Ecohydrology/hydro-ecology -Erosion and sediment -Tracer hydrology
