

Automorphic Forms on $SL_2(\mathbb{R})$ (Cambridge Tracts in Mathematics)

This book provides an introduction to some aspects of the analytic theory of automorphic forms on $G=SL_2(\mathbb{R})$ or the upper-half plane X , with respect to a discrete subgroup Γ of G of finite covolume. The point of view is inspired by the theory of infinite dimensional unitary representations of G ; this is introduced in the last sections, making this connection explicit. The topics treated include the construction of fundamental domains, the notion of automorphic form on $\Gamma \backslash G/G$ and its relationship with the classical automorphic forms on X , Poincaré series, constant terms, cusp forms, finite dimensionality of the space of automorphic forms of a given type, compactness of certain convolution operators, Eisenstein series, unitary representations of G , and the spectral decomposition of $L^2(\Gamma \backslash G/G)$. The main prerequisites are some results in functional analysis (reviewed, with references) and some familiarity with the elementary theory of Lie groups and Lie algebras.
